Section 1 Introduction

1.1 Purpose

This documentation outlines the setup and configuration of the AI Voice Agent Abandoned Checkout System, an automated solution to recover lost sales from abandoned carts in your Shopify store. By integrating Shopify with n8n workflows, this system uses an AI voice agent to contact customers, offer personalized assistance or discounts, send SMS follow-ups, and store interaction data in Airtable.

1.2 Scope

The guide focuses on configuring one Shopify workflow and two n8n workflows, emphasizing only the essential changes needed for setup.

Section 2 System Overview

2.1 Description

The system automates the recovery of abandoned checkouts by triggering calls within a **10:00 AM to 12:00 AM** window, based on the customer's local time. It uses Shopify to detect abandoned carts, n8n to manage call logic and SMS, Twilio for communication, VAPI for the voice agent, and Airtable for data storage.

2.2 Workflow Process

2.2.1 Trigger

Customer abandons checkout in Shopify.

2.2.2 Location Check

Determines customer's country and local time.

2.2.3 Call Decision

Assesses if the time is suitable (10 AM–12 AM). If not, schedules the call.

2.2.4 Call Execution

Selects a phone number (e.g., US or UK) and initiates a call.

2.2.5 Engagement

1. If unanswered: Retries after 10 minutes; if still unanswered, sends an SMS with a cart link and discount code.
2. If answered: Engages in conversation, offering discounts or scheduling callbacks as needed.

2.2.6 Data Storage

Logs call details in Airtable.

Section 3 Shopify Workflow Configuration

3.1 Abandoned Checkout Trigger

Change Needed:

Update Webhook URL:

- In n8n, copy the "Production URL" from "1. Abandoned Checkout Trigger > Outbound Call" webhook node.
- In Shopify, paste it into the HTTP request node of the "Abandoned Cart Trigger > n8n" workflow.

Figure 1.1: Configuring the Webhook URL in Shopify Workflow

Section 4 n8n Workflow Configuration

4.1 Abandoned Checkout Trigger > Outbound Call

Change Needed:

1. Set Shopify Credentials:
 - a. Add your Shopify access token and store URL in the Shopify node.
2. Set VAPI Key and Assistant ID:
 - a. Paste your VAPI private key and Assistant ID into the VAPI node fields.
3. Configure Phone Numbers:
 - a. Insert US and UK phone number IDs from VAPI into the phone number fields.
4. Set Discount Parameters:
 - a. Update the discount rate (e.g., 10%) and minimum cart value (e.g., \$5) in the discount node.
5. Configure Twilio:
 - a. Enter your Twilio phone number, Account SID, and Auth Token in the Twilio node.

4.1 End Of Call Report > Generate Discount? > Send SMS

Changes Needed

1. Connect to Airtable:
 - a. Paste your Airtable access token into the Airtable credential node.
2. Set Base and Table IDs:
 - a. Copy your Airtable Base ID and Table ID from the URL and paste them into the respective fields.
3. Configure Phone Numbers and Shopify Credentials:
 - a. Add US and UK Twilio phone numbers and Shopify credentials (access token and store URL) in the marked nodes.
